Lock xml content for translation, but show it locked in translate5

This works since Okapi 1.46, which will be usable in translate5, when
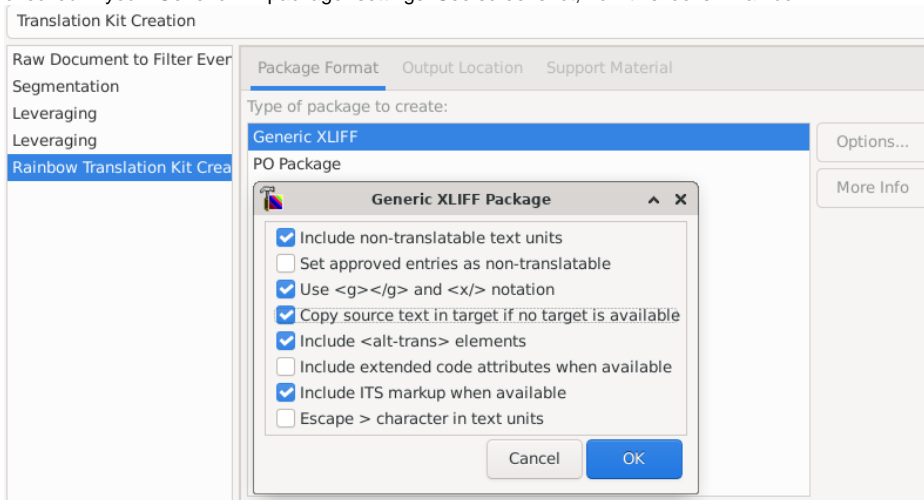

⬆ **TRANSLATE-3202** - Adopt File Format Settings for OpenXML to Okapi version 1.4.6 `SELECTED FOR DEV`

will be released (status "done").

In Okapi it refers to https://bitbucket.org/okapiframework/okapi/pull-requests/754

To use it, do the following:

1. Change the default pipeline used inside the Okapi bconf file (that is used inside translate5), so that the flag "include non-translatable text-units" is checked in your "Generic xliff package" settings. See screenshot, how this looks in rainbow:

   In the pipeline file, that rainbow saves and that is included in the bconf, when a bconf is created, this setting is reflected by setting to "true" the following line:

   writerOptions.includeNoTranslate.b=true
2. Create an ITS-based xml filter, that uses the option "extractUntranslatable" as explained here
   https://okapiframework.org/wiki/index.php/XML_Filter#extractUntranslatable
