Star Transit NXT language pairs

translate5 supports the Start Transit NXT language pairs for import and export. Details to import transit files can be found here.

Track changes

Changes can be tagged in Transit language pairs in the export using HTML syntax (be careful: this is not useful inside Transit and may break it. It is only for use on file level).

Adding information to the segment info field of Transit on the export

translate5 can write the following information to the segment info field of Transit on export time:

- export date (or a fixed date set in configuration)
- translate5 manual segment status
- source- and target-terms of term-pairs, where the status of the source-term switched from "transNotFound" to "transFound"

If any of this information is added can be configured in the system config of translate5 for each bullet item separately.
