

SDLXLIFF

translate5 supports SDLXLIFF as import format.

SDL Comments

Comments on segment level can be imported or ignored if enabled in the config. To enable that feature set `runtimeOptions.import.sdlxliff.importComments` to 1, more information about [configuration](#).

Target comments: if there are comments on specific words only, they are converted to comments pointing to the whole segment. This changes to the comments are persisted to the SDLXLIFF file on export.

Source comments are imported too. Single words comments remain here, since the source content can not be changed.

SDL TrackChanges / change-marks

If there is TrackChanges markup in SDLXLIFF, the made changes can automatically be applied to the content on import time

If client's **TrackChanges** plugin is **inactive** and `runtimeOptions.import.sdlxliff.applyChangeMarks` set to **true** all contents that are marked "deleted" in sdxliff will be deleted from the segment. All contents marked as "added" will stay and trackchanges markup will be removed. (this is current behavior, but independent of TrackChanges plug-in)

If client's **TrackChanges** plugin is **inactive** and `runtimeOptions.import.sdlxliff.applyChangeMarks` set to **false** An error will be thrown and import aborted

If **TrackChanges** plugin is **active** and `runtimeOptions.import.sdlxliff.applyChangeMarks` set to **true** the config will do nothing at all. TrackChanges markup in sdxliff will lead to trackChanges markup in translate5

If **TrackChanges** plugin is **active** and `runtimeOptions.import.sdlxliff.applyChangeMarks` set to **false** the config will do nothing at all. TrackChanges markup in sdxliff will lead to trackChanges markup in translate5

By default **TrackChanges** plugin is **inactive** and `runtimeOptions.import.sdlxliff.applyChangeMarks` set to **true**, to disable that feature set `runtimeOptions.import.sdlxliff.applyChangeMarks` to 0, more information about [configuration](#).

If **TrackChanges** plugin is **inactive** and `runtimeOptions.import.sdlxliff.applyChangeMarks` set to **true** the changes are applied to the content, the whole change-mark information is removed from the SDLXLIFF file, change-mark meta information (like time of change and author of a specific change) is getting lost.

Track changes on export

The SDLXLIFF-syntax for the "track changes" functionality is supported in the export.
