

MT-ComparEval

This plug-in is currently deprecated and not longer supported. In case of interest it could be reactivated. Please contact in that case support support@translate5.net.

Category	Third party tool integration
Purpose	Integrates the third party tool MT-ComparEval.
Third party URL	https://github.com/choko/MT-ComparEval
Bootstrap Class	editor_Plugins_MtComparEval_Bootstrap
Type	Core plug-in (delivered with translate5 core)

Description

Integrates the third party tool [MT-ComparEval](https://github.com/choko/MT-ComparEval) into translate5.

MT-ComparEval is a tool for comparison and evaluation of machine translations. It allows users to compare translations according to several criteria, such as:

- *automatic metrics of machine translation quality computed either on whole documents or single sentences*
- *quality comparison of single sentence translation by highlighting conrmed, improving and worsening n-grams*
- *summaries of the most improving and worsening n-grams for the whole document.*

MT-ComparEval also plots a chart with absolute differences of metrics computed on single sentences and a chart with values obtained from paired bootstrap resampling.

This description is from <https://github.com/choko/MT-ComparEval>.

Installation

On the [MT-ComparEval homepage](#) you find also the installation instructions for MT-ComparEval, currently only available for Linux.

In addition to the installation instructions there, you can change the default server configuration of MT-ComparEval from localhost:8080 to whatever you want by changing this in the bin/server.sh directly.

The server address <http://localhost:8080> is the default configured URL for MT-ComparEval in translate5, this can be changed in translate5 config, see below.

System-Requirements

In PHP must be enabled PDO with sqlite.

Configuration

Config name	Values	Default	Description
runtimeOptions.plugins.MtComparEval.url	URL	http://localhost:8080	Base URL to the MT-ComparEval Tool, for format see default value

Debugging

Adding the following line to your installation.ini enables debugging output for MtComparEval Plugin.

```
runtimeOptions.debug.plugin.MtComparEval = 1
```

Enabled debugging with the value 1 enables more verbose output of the communication between translate5 and MT-ComparEval.

Plug-In removed from translate5

The plug-in code was removed from the translate5, since the MtComparEval server was not running anymore with PHP7.

The code was removed from the translate5 repository in commit 962d3c1100b15f710af99d66265fda871c4d7862 on 18.04.2019.

The latest Plug-In code is also available here as ZIP file:
