

Database

- [Migration from windows lowercase table names to Linux camel case](#)
- [Modify database and table charsets](#)
- [MySQL Error Number 1005 Can't create table 'sometable' \(errno: 150\)](#)
- [SQLSTATE\[HY000\]: General error: 1206 The total number of locks exceeds the lock table size](#)
- [strange foreign key errors on table creation / data manipulation](#)

Database Schema Cache

By default the database schema is cached in translate5. For development this makes less sense, so caching can be disabled by putting the following line into a developers installation.ini:

```
resources.db.defaultMetadataCache = false
```

When using the database updater the caches are purged. So a pure git installation where no active development is done, should work like a charm with enabled cache.
