

Match-analysis

Category	Import / Pre-translation / Analysis
Purpose	1. Best matchrate value for each segment from the currently associated language resources. 2. Pre-translate the segments from the associated language resources. 3. Run term tagging
Bootstrap Class	editor_Plugins_MatchAnalysis_Init
Type	Plug-in

Description

This plug-in is enabled by default since it provides the core functionality of analysing to be translated content against the configured language resources.

Configuration

Name	ID	purpose
Match rate boundaries	runtimeOptions. plugins. MatchAnalysis. fuzzyBoundaries	• The match rate boundaries to be used in the analysis can be configured. • The values greater or equal to 100 must be covered by the configuration, since they are needed internally. • The values below 100 can be configured as needed, yet there may not be gaps between the boundaries and they may not overlap. • <i>Example: 104-100;99-90;85-80; This is invalid, since there is a gap between 90 and 85.</i> • For the XML export of the analysis only the ranges < 100 are relevant since only that ranges are customizable regarding the used XML format. The configuration or grouping of values >= 100 affects only the analysis shown directly in translate5 and in the excel export. • The lower values not configured are considered as "no match".
