

Translate5 5.0.12 - 2020-10-21

Important Notes:

Under Linux the install-and-update script may produce the following error output:

```
./install-and-update.sh: Zeile 34: Dateiende beim Suchen nach »"« erreicht.
```

```
./install-and-update.sh: Zeile 35: Syntaxfehler: Unerwartetes Dateiende.
```

This is no problem! The reason is just, that the install-and-update.sh file was updated during the update.

Changed

TRANSLATE-2279: Integrate git hook checks

Development: Integrate git hooks to validate source code.

Bugfixes

TRANSLATE-2282: Mixing XLF id and rid values led to wrong tag numbering

When in some paired XLF tags the rid was used, and in others the id to pair the tags, this could lead to duplicated tag numbers.

TRANSLATE-2280: OpenTM2 is not reachable anymore if TMPrefix configuration is empty

OpenTM2 installations were not reachable anymore from the application if the tmprefix was not configured. Empty tmprefixes are valid again.

TRANSLATE-2278: Check if the searched text is valid for segmentation

Text segmentation and text segmentation search in instant-translate only will be done only when for the current search TM is available or risk-predictor (ModelFront) is enabled.

TRANSLATE-2277: UserConfig value does not respect config data type

The UserConfig values did not respect the underlying configs data type, therefore the preferences of the repetition editor were not loaded correctly and the repetition editor did not come up.

TRANSLATE-2265: Microsoft translator directory lookup change

Solves the problem that microsoft translator does not provide results when searching text in instant translate with more than 5 characters.

TRANSLATE-2264: Relative links for instant-translate file download

Fixed file download link in instant translate when the user is accessing translate5 from different domain.

TRANSLATE-2263: Do not use ExtJS debug anymore

Instead of using the debug version of ExtJS now the normal one is used. This reduces the initial load from 10 to 2MB.

TRANSLATE-2262: Remove sensitive data of API endpoint task/userlist

The userlist needed for filtering in the task management exposes the encrypted password.

TRANSLATE-2261: Improve terminology import performance

The import performance of large terminology was really slow, by adding some databases indexes the imported was boosted.

TRANSLATE-2260: Visual Review: Normalizing whitespace when comparing segments for content-align / pivot-language

Whitespace will now be normalized when aligned visuals in the visual review or pivot languages are validated against the segments

TRANSLATE-2252: Reapply tooltip over processing status column

The tool-tips were changed accidentally and are restored now.

TRANSLATE-2251: Reapply "Red bubble" to changed segments in left side layout of split screen

The red bubble representing edited segments will now also show in the left (unedited) frame of the split-view of the visual review

TRANSLATE-2250: Also allow uploading HTML for VisualReview

Since it is possible to put HTML files as layout source in the visual folder of the zip import package, selecting an HTML file in the GUI should be allowed, too.

TRANSLATE-2245: Switch analysis to batch mode, where language resources support it

Sending multiple segment per request when match analysis and pre-translation is running now can be configured in (default enabled): runtimeOptions.plugins.MatchAnalysis.enableBatchQuery; Currently this is supported by the following language resources: Nectm, PangeaMt, Microsoft, Google, DeepL

TRANSLATE-2220: XML/XSLT import for visual review: Filenames may not be suitable for OKAPI processing

FIX: Any filenames e.g. like "File (Kopie)" now can be processed, either as aligned XML/XSLT file or with a direct XML/XSL import
