

# LanguageTool for SpellCheck-Plugin

Language Tool offers a public version to use. Yet, the SpellCheck-Plugin will work fastest when you use your own local LanguageTool-Server.

For Installation:

- Download: <https://www.languagetool.org/download/>
- Install LanguageTool as shown here: <https://dev.languagetool.org/http-server>  
(Please note: "For security reasons, the server will not be accessible from other hosts. If you want to run a server for remote users you will need to use the --public option.")
- If your server runs an SSD hard disk, we recommend downloading, configuring and using ngrams for languageTool as shown here: <https://dev.languagetool.org/finding-errors-using-n-gram-data>
- If you want to add additional languages for spell checking with hunspell, that languageTool does usually not support, [follow the instructions here](#).
- For Ubuntu, additional information is shown here: <https://wiki.ubuntuusers.de/LanguageTool/>
- For using the public version, see here: <https://dev.languagetool.org/public-http-api>
- Configure the SpellCheck-plugin as shown here: [SpellCheck](#)
