

./translate5.sh auth:apptoken:add

For using translate5 via API the authentication against the API must be done via an app token (starting with version 5.8.2 / 5.8.3).

Authentication via username / password will not be possible anymore (for security reasons).

Currently the maintenance (add / delete / list) of tokens is only doable via translate5 CLI tool. See below.

The maintenance of tokens per user in the UI is planned, but funding is required.

App token command

```
server:/var/www/translate5$ ./translate5.sh auth:apptoken:add --help
```

Description:

Generates auth token used for authentication in translate5

Usage:

```
auth:apptoken:add <login> <desc>
```

Arguments:

login	User login for whom this authentication token will be generate for
desc	Description for the generated token

Options:

-h, --help	Display help for the given command. When no command is given display help for the list command
-q, --quiet	Do not output any message
-V, --version	Display this application version
--ansi --no-ansi	Force (or disable --no-ansi) ANSI output
-n, --no-interaction	Do not ask any interactive question
-v vv vvv, --verbose	Increase the verbosity of messages: 1 for normal output, 2 for more verbose output and 3 for debug

Help:

Generates auth token used for authentication in translate5. The command will generate and display the token which can be used for authenticating in translate5
