Task Templates

This version of task-template will no longer work with translate5 v >=translate5 - 5.1.0 !

Task templates will become an easy concept to overwrite system configuration on task level.

They are evaluated on import time - and later on maybe at other stages, too.

At the time being they can be used to configure tag protection and protection by regex in CSV files.

Lenghts restrictions can also be set.

The current syntax is as the attached file shows. Syntax documentation is included in the file.
